Supporting your Perinatal Units During COVID-19: Breastfeeding Guidance

September 10, 2020
Webinar Logistics

• Attendees are automatically muted upon entry

• The “chat” function has been disabled. Please utilize the Q&A box if you are having technical difficulties and to submit any questions you have for the presenters. We will answer a select number of questions relevant to the topics presented during the Q&A portion of the webinar. The remainder of the questions may be used to inform the topics of future webinars in this series.

• The slides and webinar recording will be made available on www.CAperinatalprograms.org shortly after the webinar. Due to the rapidly changing guidelines around COVID-19, the slides and recording may be taken down after two weeks.
The information shared in this webinar series and on our resource site serve as examples of how hospitals, healthcare workers, and families in California are responding to COVID-19. We understand that each hospital is working with a different set of resources and constraints. As such, some of the recommendations presented may not apply to your hospital setting. Guidelines and recommendations should be adapted to fit your local needs.

As this is a rapidly evolving public health situation, we encourage you to consider the most recently available local health department and CDC guidance when developing your internal protocols.
Today’s Presenters

- **Elliot Main, MD**, Clinical Professor of Obstetrics and Gynecology (Maternal-Fetal Medicine), Stanford University School of Medicine and Medical Director, CMQCC
- **Susan Crowe, MD**, Clinical Professor of Obstetrics and Gynecology (Maternal-Fetal Medicine), Stanford University School of Medicine
- **Janelle Aby, MD**, Clinical Professor of Pediatrics, Stanford University School of Medicine
- **Robbie Gonzalez-Dow, MPH, RD**, Executive Director, California Breastfeeding Coalition

The TEN STEPS to Successful Breastfeeding

1. **ANTENATAL CARE**
   - Discussing the importance of the mother and her baby
   - Community nutrition services

2. **CARE RIGHT AFTER BIRTH**
   - Encouraging skin-to-skin contact between mother and baby soon after birth

3. **SUPPORT MOTHERS WITH BREASTFEEDING**
   - Providing support for breastfeeding
   - Early initiation of breastfeeding

4. **SUPPLEMENTING**
   - Giving only breast milk unless there are medical reasons

5. **ROOMING-IN**
   - Letting mothers and babies sleep together

6. **RESPONSIVE FEEDING**
   - Helping mothers know when their baby is hungry

7. **BOTTLES, TEATS AND PACIFIERS**
   - Refering mothers to community breastfeeding support services

World Health Organization

UNICEF

SDG 3: Good health and well-being
Early Evolution of Breastfeeding Guidance During COVID-19

**CDC: 2/2020**
- Temporary separation of COVID positive/PUI mother and her baby

**AAP: 4/2/2020**
- 6 ft separation if space constraints or mother’s choice
- Mother’s milk may provide protective factors against COVID

**ACOG: 4/16/2020**
- Not enough info on transmission through breastmilk
- Breastmilk protective against many illness and best nutrition for most babies

**CDC: 5/20/2020**
- Shared decision making on temporary separation, variety of options on how to achieve
- Limited data suggest breastmilk is not likely to be a source of transmission

**WHO: 3/2020**
- Room share, direct breastfeeding, skin-to-skin

**CDC: 4/4/2020**
- Case-by-case basis
- Shared decision making

**CDC: 5/5/2020**
- Instructions for Mother
- Instructions for Expressed Milk
- Guidelines for Breastfeeding Employees
CDC: 2/2020

“To reduce the risk of transmission of the virus that causes COVID-19 from the mother to the newborn, facilities should consider temporarily separating (e.g., separate rooms) the mother who has confirmed COVID-19 or is a PUI from her baby until the mother’s transmission based precautions are discontinued...”
The content on these slides is current as of September 10, 2020.

World Health Organization: 3/2020

- “…even if a mother has COVID-19, she is encouraged to touch and hold her baby, breastfeed safely with good respiratory hygiene, hold the baby skin-to-skin, and share a room with the child.”
- Recommend direct breastfeeding and skin to skin
The content on these slides is current as of September 10, 2020.

AAP Initial Guidance: 4/2/2020

• “While difficult, temporary separation of mother and newborn will minimize the risk of postnatal infant infection from maternal respiratory secretions.”

• “If the center cannot place the infant in a separate area — or the mother chooses rooming-in despite recommendations — ensure the infant is at least 6 feet from the mother. A curtain or an isolette can help facilitate separation.”

• In addition to the known benefits of breastfeeding, mothers’ milk may provide infant protective factors after maternal COVID-19. Promoting breast milk feeding and supporting establishment of maternal milk supply may offer additional benefits to well and sick newborns.
“Determination of whether to keep a mother with known or suspected COVID-19 and her infant together or separated after birth on a case-by-case basis, using shared decision-making between the mother and the clinical team.”
"The many benefits of mother/infant skin-to-skin contact are well understood for mother-infant bonding, increased likelihood of breastfeeding...and though transmission of SARS-CoV-2 after birth with infectious respiratory secretions is a concern, the risk of transmission and the clinical severity...in infants are not clear."
CDC: To Separate or Not?

Consider:

- Clinical condition of mother and infant
- Testing results of mother and infant
- Desire to feed at the breast
- Facility capacity
- Ability to maintain separation at discharge

CDC: 2/2020
WHO: 3/2020
CDC: 4/4/2020
CDC: 4/16/2020
AAP: 4/2/2020
ACOG: 4/16/2020
CDC: 5/20/2020
CDC: 5/5/2020
CDC: Co-isolation

- Keep newborn 6 feet away from mother
- Physical barriers
- If feeding at the breast, mother should place facemask, hand hygiene before feed
“So far, the virus has not been found in breast milk. But there is not enough information yet on whether women who are sick can pass the virus through breast milk. Breast milk gives babies protection against many illnesses. It also is the best source of nutrition for most babies. Talk with your ob-gyn or other health care professional about whether to start or continue breastfeeding. You can make this decision together with your family and health care team.”
• Mother should be instructed to wash her hands using soap and water, especially if her hands are visibly soiled, before touching the infant.
• If soap and water are not available, she should use a hand sanitizer with at least 60% alcohol.
• Mothers should wear a cloth face covering while feeding at the breast.
If expressing breast milk either by hand expression or with a breast pump, the mother should clean her hands before touching any pump or bottle parts and wear a cloth face covering.

Mothers should be educated about recommendations on how to properly clean and sanitize breast pumps.

If possible, expressed breast milk should be fed to the infant by a healthy caregiver, who is not at high-risk for severe illness from COVID-19.
Breastfeeding mothers who work in settings with higher risk of potential exposure to SARS-CoV-2, such as healthcare personnel and first responders, may have additional concerns related to expression of breast milk while at work. These mothers should follow the same recommendations outlined above given they may be at higher risk of infection with SARS-CoV-2. Ideally, employers would provide breastfeeding employees with a private, non-bathroom space for milk expression.
There is evidence that SARS-CoV-2 remains on surfaces for several hours to days. Healthcare providers should discuss a mother’s individual circumstances (e.g., level of exposure to persons with suspected or confirmed COVID-19, availability and proper use of personal protective equipment) when counseling the mother about additional precautions prior to breastfeeding or expression of breast milk while at work.

There is a lack of evidence to support precautions such as cleansing the breast prior to breastfeeding or milk expression or disinfecting external surfaces of milk collection devices (e.g., bottles, milk bags).
The content on these slides is current as of September 10, 2020.

4/2/20-5/20/20

- CDC guidance: primarily recommending shared decision making
- AAP guidance: primarily recommending separation of dyads
Patient Counseling:  
What was NOT known (4/2020)

• Whether mother-infant separation decreases coronavirus transmission ..... or if it does, to what extent.
• For how long someone with COVID-19 remains contagious.
• For babies who have required hospitalization for COVID-19, it is not known whether or not they were breastfed or cared for by a COVID-19 positive caregiver.
There have not yet been any neonates <28 days old who have died from COVID-19, anywhere in the world.

The two infants who died in the US with possible COVID-19 were 6 weeks and 9 months old. In both cases, the causes of death are still under investigation. It is not yet known if COVID infection contributed to the deaths.

The number of infants who get sick with COVID-19 is very small compared with the number of adults who get sick.
Benefits of Co-Location

• Consistent with current WHO recommendation, which says mothers with suspected or confirmed COVID-19 “should be enabled to remain together and practice skin-to-skin contact, kangaroo care and to remain together and to practice rooming in throughout the day and night.”

• Enables skin-to-skin contact which improves temperature, heart rate, respiratory rate, and glucose levels in newborns.

• Enables breastfeeding, a feeding method associated with a decreased risk of pneumonia and other infections. Infants who are not breastfed have 3.5 x the risk of being hospitalized for pneumonia compared with infants who are breastfed exclusively for ≥ 4 months.

• Provides consistent newborn care practices across both hospital and home environment for those families who will NOT be separated after discharge.

• Allows new mothers to have help with breastfeeding initiation and develop skills for calming and caring for their babies.

• Decreases stress for mothers.

• Enables modeling of good hand washing and mask use during infant care.

Thank you Dr. Janelle Aby, Medical Director LPCH Well Baby Newborn Nursery
Benefits of Mother-Infant Separation

• Provides consistent newborn care practices across both hospital and home environment for those families who WILL be separated after discharge.

• May be temporarily easier for mothers or staff if the mother is unwell or is having difficulty managing cough or secretions.

Thank you Dr. Janelle Aby
Although temporary separation of a neonate from a mother with confirmed or suspected COVID-19 should be strongly considered in healthcare settings, it may not always be feasible. For these situations, the risks and benefits of temporary separation of the mother from her baby should be discussed with the mother by the health care team, and decisions about temporary separation should be made in accordance with the mother’s wishes.
Temporary **separation in the clinical setting** can be achieved in many ways, including a separate room, maintaining a physical distance of ≥6 feet between the mother and neonate, and placing the neonate in a temperature-controlled isolette if the neonate remains in the mother’s room.

**CDC**: 5/20/20
Considerations include:

- **Clinical conditions** of the mother and neonate
- Separation may be necessary for infants at higher risk for severe illness (e.g., preterm infants and infants with medical conditions)
- Availability of testing, staffing, space, and PPE in the healthcare facility
Breast milk is the best source of nutrition for most infants, and it provides protection against many illnesses. There are rare exceptions when breastfeeding or feeding expressed breast milk is not recommended. We do not know whether mothers with COVID-19 can transmit the virus via breast milk, but the limited data available suggest this is not likely to be a source of transmission.
• Approximately 2-5% of infants born to women with COVID-19 near the time of delivery have tested positive in the first 24-96 hours after birth.

• There are published reports of infants requiring hospitalization before one month of age due to severe COVID-19 infection.

• Families can now be informed that evidence to date suggests that the risk of the newborn acquiring infection during the birth hospitalization is low when precautions are taken to protect newborns from maternal infectious respiratory secretions.
• Among the over 1,500 mother-infant dyads in the National Perinatal COVID-19 Registry, the likelihood that an infant has a positive PCR test for SARS-CoV-2 is similar for infants who are separated from their mothers and for infants who room-in with mothers using infection prevention measures.
We recommend:

• **Mothers and newborns may room-in** according to usual center practice.

• During the birth hospitalization, the mother should **maintain a reasonable distance from her infant when possible**. When mother provides hands-on care to her newborn, **she should wear a mask and perform hand-hygiene**. Use of an isolette may facilitate distancing and provide the infant an added measure of protection from respiratory droplets.
• Delayed cord clamping practices should continue per usual center practice. Mothers with COVID-19 should use a mask while holding their baby during delayed cord clamping.

• Infants born to mothers with confirmed or suspected COVID-19 should be bathed after birth to remove virus potentially present on skin surfaces.

• No further mention of “breast hygiene.”
The AAP strongly supports breastfeeding as the best choice for infant feeding. Several published studies have detected SARS-CoV-2 nucleic acid in breast milk. It is not yet known whether viable, infectious virus is secreted in breast milk, nor is it yet established whether protective antibody is found in breast milk. Given these uncertainties, breastfeeding is not contraindicated at this time.
• Mothers should perform hand hygiene before breastfeeding and wear a mask during breastfeeding.

• If an infected mother chooses not to nurse her newborn, she may express breast milk after appropriate hand hygiene, and this may be fed to the infant by other uninfected caregivers.

• Mothers of NICU infants may express breast milk for their infants during any time that their infection status prohibits their presence in the NICU.
• There is no specific benefit for infants born to mothers with COVID-19 that results from discharge earlier than usual center practice.

• A COVID+ mother (asymptomatic or not severely ill) should use a mask and hand-hygiene when directly caring for the infant, until
  • she has been afebrile for 24 hours without use of antipyretics
  • at least 10 days have passed since her symptoms first appeared (or, in the case of asymptomatic women identified only by obstetric screening tests at least 10 days have passed since the positive test), and
  • symptoms have improved.
AAP: 7/22/20 NICU Visitation

- Immunocompetent persons may be considered non-infectious as per prior slide. For persons severely or critically ill with COVID-19, and for severely immunocompromised individuals, the length of time since symptoms first appeared can be extended to 20 days.

- Extending that period to 14-20 days from onset of symptoms or first positive test (whichever comes first) is a reasonable option that will provide additional protection in the NICU environment.

- Use of PCR test-based criteria to determine when individuals are no longer infectious may unnecessarily restrict visitation.
• Transmission of SARS-CoV-2, the virus that causes COVID-19, to neonates is thought to occur primarily through respiratory droplets during the postnatal period.

• There are insufficient data to make recommendations on routine delayed cord clamping or immediate skin-to-skin care for the purpose of preventing SARS-CoV-2 transmission to the neonate.
Current evidence suggests that SARS-CoV-2 infections in neonates are uncommon. If neonates do become infected, the majority have either asymptomatic infections or mild disease (i.e., do not require respiratory support), and they recover.

Severe illness in neonates, including illness requiring mechanical ventilation, has been reported but appears to be rare.

Neonates with underlying medical conditions and preterm infants (<37 weeks gestational age) may be at higher risk of severe illness from COVID-19.
Rates of SARS-CoV-2 infection in neonates do not appear to be affected by mode of delivery, method of infant feeding, or contact with a mother with suspected or confirmed SARS-CoV-2 infection.

The ideal setting for care of a healthy, term newborn while in the hospital is in the mother’s room, commonly called “rooming-in.”

There is no difference in risk of SARS-CoV-2 infection to the neonate whether a neonate is cared for in a separate room or remains in the mother’s room.

Healthcare providers should respect maternal autonomy in the medical decision-making process.
Mothers who room-in with their infants can more easily learn and respond to their feeding cues, which helps establish breastfeeding. Breastfeeding reduces morbidity and mortality for both mothers and their infants. Mothers who choose to breastfeed should take measures, including wearing a mask and practicing hand hygiene.

Mother-infant bonding is facilitated by keeping the neonate with its mother.

Rooming-in promotes family-centered care and can allow for parent education about newborn care and infection prevention and control practices.
Mothers with suspected or confirmed SARS-CoV-2 infection should not be considered as posing a potential risk of virus transmission to their neonates if they have met the criteria for discontinuing isolation and precautions:

- At least 10 days have passed since their symptoms first appeared (up to 20 days if they have more severe to critical illness or are severely immunocompromised), and
- At least 24 hours have passed since their last fever without the use of antipyretics, and
- Their other symptoms have improved.

CDC: 8/3/20 IPC Precautions
• Separation may be necessary for mothers who are too ill to care for their infants or who need higher levels of care.

• Separation may be necessary for neonates at higher risk for severe illness (e.g., preterm infants, infants with underlying medical conditions, infants needing higher levels of care).

• Separation in order to reduce the risk of transmission from a mother with suspected or confirmed SARS-CoV-2 to her neonate may not be necessary if the neonate tests positive for SARS-CoV-2.
• Mothers should wear a mask and practice hand hygiene during all contact with their neonates. Of note, plastic infant face shields are not recommended, and masks should not be placed on neonates or children younger than 2 years of age.

• Engineering controls, such as maintaining a physical distance of >6 feet between the mother and neonate or placing the neonate in an incubator, should be used when feasible.
Exclusive Breastfeeding Matters for Both Short and Long-Term Health Outcomes

- Some breastfeeding benefits are more apparent in exclusively breastfed infants than in mixed fed infants (e.g. protection against ear infections)
- Other benefits rely on exclusive breastfeeding (e.g. lower respiratory tract infections and serious persistent diarrhea)
- **Some benefits are associated with direct breastfeeding** (e.g. obesity prevention, and possible reduced chance of allergy)

Clinical Care: Equity Considerations

- Poor health literacy, fear of losing employment, mistrust of medical system and government may contribute to seeking care later for respiratory symptoms
- When COVID testing and treatment resources are scarce, algorithms may “inadvertently” disproportionately disadvantage underserved populations
- Discharge for COVID-related and obstetrical admissions may require complex planning and resource allocation at a time when teams and services are thin

Credit: Dr. Lori Feldman-Winter and Dr. Lauren Hanley, CBC Webinar
Evidence for Skin to Skin: *Mother*

- Decreases maternal stress and improves paternal perception of stress in the relationship with baby
- Depression scores and salivary cortisol levels lower over the first month among postpartum mothers providing SSC
- Enhances opportunity for early first breastfeed, which in turn leads to more readiness to breastfeed, organized suckling pattern, and more success in exclusive and overall breastfeeding

Credit: Dr. Lori Feldman-Winter and Dr. Lauren Hanley, CBC Webinar
Evidence for Skin to Skin: Baby

- More likely to have successful breastfeeding with first feed
- Greater stability of cardiorespiratory system
- Higher blood glucose levels
- Decreases pain in the newborn
- Improves gastrointestinal adaptation
- Leads to more restful sleep patterns, less crying and better growth
- Improved bonding (fMRI)

• Vernix caseosa, (composed of water, proteins, barrier lipids, and antimicrobial agents), contributes to skin hydration, lower pH, and protection against pathogens, suggesting that vernix removal in non-folded locations immediately post birth can be unfavorable
  • Coughlin CC, Taieb A. Pediatric Dermatology. 2014
• Delayed immersion vs. immediate sponge baths reduce hypothermia (no increase in bf) (Brogen 2017)
• 2 hours vs. >12 hours associated with increased exclusive breastfeeding AOR=1.49 [95% CI 1.14, 1.96] (Dicioccio 2019)
• Increased overall breastfeeding AOR=2.66; [95% CI 1.29, 5.46] (Preer 2013)

TO: All Facilities

SUBJECT: Visitor Limitations Guidance
(This AFL supersedes AFL 20-38.3)

All Facilities Letter (AFL) Summary

- This AFL notifies all facilities of updated visitor guidelines for pediatric patients, patients in labor and delivery, neonatal intensive care unit (NICU) patients, pediatric intensive care unit patients (PICU) patients, and patients at end-of-life and patients with physical, intellectual, and/or developmental disabilities and patients with cognitive impairments.
- Health facilities may permit a support person to accompany a patient for whom a support person has been determined to be essential to the care of the patient ( medically necessary), including patients with physical, intellectual, and/or developmental disabilities and patients with cognitive impairments.
- This AFL has been updated to clarify that long-term care facilities and hospitals may permit students obtaining their clinical experience into the facility if they meet the CDC guidelines for healthcare workers. This revision also clarifies when a doula may be permitted during labor and delivery.
CBC LEARN WEBINAR SERIES

The California Breastfeeding Coalition is hosting webinars that provide evidence-based information and best practices related to breastfeeding in light of COVID-19. The CBC Learn series is funded by the California Health Care Foundation and supported by the California WIC Association and Inland Empire Breastfeeding Coalition. Save the dates for June 8 and June 18!

Recordings of prior webinars are still available and accessible online. Past webinars include:
- COVID-19: Infant Feeding During the Postpartum Period
- Providing the Best Possible Solutions in Less Than Ideal Circumstances
- Filling the Gap: Infant Feeding in the NICU and COVID-19 Considerations
- Making the Shift from In Person to Virtual Care and Support
- Going Home During a Pandemic: Challenges for Breastfeeding Families
- The Magical Process of Relactation
- Creating Community Online: How to Provide Connection and Support in Virtual Groups

Access past webinars at [bit.ly/2Xt56Zn](http://californiabreastfeeding.org/focus-areas/covid-19-coronavirus/)

If you’d like to discuss the webinar series and talk with other participants, join our [CBC Learn Facebook group](http://californiabreastfeeding.org/focus-areas/covid-19-coronavirus/)
La Toma De Decisiones Compartida Para La Lactancia Materna Y COVID-19

¿Usted piensa que podría tener COVID-19?

Si está enfermado o anormalmente cansado y piensa que podría tener COVID-19, su proveedor de atención médica recomienda hacer una prueba de COVID-19.

Usted todavía puede amamantar a su bebe si tiene COVID-19. Usted tendrá que decidir si quiere hacerlo.

Alimentar a su bebe directamente de su pecho

Cuando su bebe se queda en otra habitación o que alguien comienza a lavar la leche materna que se extrae del pecho.

En caso de que haya resultados positivos en la prueba de COVID-19 o tenga síntomas

Lávese las manos antes y después de tocar o alimentar a su bebe.

Cúbrase la boca y la nariz con una toalla o un paño cuando amamante o se extraiga la leche.

Mantenga una distancia de 6 pies entre usted y el bebe cuando no le estés alimentando o cuidándolo.

If you have tested positive for COVID-19 or have symptoms

Wash your hands before and after touching or feeding your baby.

Cover your nose and mouth with a mask or cloth when breastfeeding or expressing.

Keep 6 feet distance between you and baby when not feeding or caring for your baby.

Have another healthy adult help with baby’s care when possible.

Breastfeeding helps you and your baby to be healthy. Your milk protects your baby from many diseases. The COVID-19 virus has not been found to be transmitted in breast milk. Talk with your health care provider about breastfeeding during your prenatal visits and when your labor begins.

COVID-19 can spread when one person with the virus coughs, sneezes or talks near another person. The virus can also spread by touching a surface, such as a counter, door handle or phone that has the virus on it and then touching your face.

Feed your baby directly from your breast.

Think you might have COVID-19?

If you are pregnant or breastfeeding and you think you might have COVID-19, your health care provider will suggest ways to support breastfeeding and keep you and your baby healthy.

You can still provide breast milk to your baby if you have COVID-19. If you have COVID-19 and want to breastfeed, you will have to decide whether you want to:

Feed your baby directly from your breast.

Or

Have your baby stay in another room and have someone feed your baby milk that you expressed from your breast.

The content on these slides is current as of September 10, 2020.
Examples of some breastfeeding care options for mothers with COVID-19:

**Skin-to-skin care**
Improve breastfeeding and baby transitions; decreases depression for mothers

**Care Options**
- Immediate skin-to-skin care after birth
- Skin-to-skin delayed and with a healthy caregiver

**Newborn bath**
Delayed bath helps normal newborn transitions; bathing may reduce virus exposure

**Care Options**
- Delay baby bath until after first feeding
- Bathe baby immediately after birth

**Temporary separation of baby from mother**
Not shown to reduce virus exposure; may be hard to create a strong milk supply

**Care Options**
- Baby in mother’s room with 6 feet distance and possible curtain barrier
- Baby cared for in a separate room

**Breastfeeding**
Protects baby from infections and illnesses; provides many health benefits for baby and mother

**Care Options**
- Baby feeds at the breast
- Mother’s milk is expressed and fed to baby by a healthy caregiver
Q&A

Christina Oldini, MBA, RN, CPHQ
• The information shared in this webinar series and on our resource site serve as examples of how hospitals, healthcare workers, and families in California are responding to COVID-19. We understand that each hospital is working with a different set of resources and constraints. As such, some of the recommendations presented may not apply to your hospital setting. Guidelines and recommendations should be adapted to fit your local needs.

• As this is a rapidly evolving public health situation, we encourage you to consider the most recently available local health department and CDC guidance when developing your internal protocols.
